

SS-RESfM: Venue Acceptance Chances & Submission Paths

Estimates as of September 10, 2026

1. The distinction that frames everything

3DV is judged on the frozen August 28 version. Every other venue would receive the *strengthened* paper: the causal in-distribution contamination curve, the Olsson clean-benchmark collapse figures, the cross-generalization invariance grid, the seed-interaction analysis, and the complete 5-seed baseline bands (ESFM*, vanilla-ESFM, COLMAP, GLOMAP, GASFM, hybrid). The frozen version predates all of it.

All percentages are one rater’s calibration with honest $\pm 10\text{pp}$ error bars. The single biggest variable is the Ronen co-authorship question (Section 4).

2. Venue-by-venue table

Venue	Version judged	Submission deadline	Notification	Est. accept.
3DV 2027	frozen (Aug 28)	submitted ✓	Dec 2, 2026	~45%
ICLR 2027	strengthened	~Sep 24–28, 2026	~mid-Jan 2027	~35–40%
CVPR 2027	strengthened	Nov 7–12 (abstract ~Nov 3)	reviews ~mid-Jan; final late Feb	~45%
ICML 2027	strengthened	~late Jan 2027	~early May 2027	~30–35%
ICCV 2027	strengthened++	~Mar 5, 2027	~June 2027	~45–50%

Per-venue notes.

- **3DV:** lower bar, solid fit; but the frozen version is missing the paper’s best material. Rebuttal playbook exists (PATHA_3dv_rebuttal_prep.pdf).
- **ICLR:** RESfM itself is ICLR 2025 — real home-venue precedent; the master draft is already in ICLR format. But the deadline is ~2 weeks away, requires immediate blind 3DV withdrawal, and reviews are public. Alive only until ~Sep 24.
- **CVPR:** SfM-literate reviewers, best-informed feedback; requires blind 3DV withdrawal; findings-paper / no-SOTA objection is the main risk. Ronen as co-author pushes this to ~50%+.
- **ICML:** private reviews (the political advantage); ML-venue fit lottery for SfM content; the only strengthened-paper branch requiring *no* blind withdrawal (3DV answers Dec 2 first).
- **ICCV:** home community; by March the paper could add dense-features results and the VGPA composition probe — the strongest version submits here.

3. Path probabilities (chance that *some* venue accepts)

Single-venue rates are not the decision — the fallback *paths* are. Assuming independent draws at the per-venue rates above:

- **Keep-3DV path:** 3DV (45%) $\rightarrow$ if rejected Dec 2, ICML ($\sim 33\%$) $\rightarrow$ if rejected, ICCV ($\sim 47\%$). Chance at least one of the three says yes: $1 - (0.55 \times 0.67 \times 0.53) \approx 80\%$.
- **Withdraw-for-CVPR path:** CVPR (45%) $\rightarrow$ if rejected, ICCV ($\sim 47\%$). Chance at least one says yes: $1 - (0.55 \times 0.53) \approx 70\%$.

How to read the 80% vs. 70%. The keep-3DV path scores higher *only* because it contains three draws instead of two — the pending 3DV submission is a free draw already in hand. It is *not* a statement that 3DV is easier than CVPR; per-venue both sit at $\sim 45\%$.

The value asymmetry that cuts the other way. The 80% path’s most likely acceptance is the *frozen August version at 3DV* — the weakest publishable outcome, which also strands the strengthened material in a follow-up paper exposed to “delta over your own 3DV paper” objections. The 70% path’s acceptances are the *full strengthened paper at CVPR or ICCV* — strictly better outcomes. Slightly fewer bites at the apple, but every bite is at a better apple.

4. The Ronen branch (the actual decision tree)

- **Ronen joins as co-author** $\Rightarrow$ withdraw 3DV, submit CVPR ($\sim 50\%+$ with him; his involvement converts the political exposure into endorsement).
- **Ronen explicitly blesses solo submission** (“submit on your own, acknowledgment is enough”) $\Rightarrow$ *still* withdraw and submit CVPR. The political risk came from submitting without his knowledge, not from his absence on the byline; an explicit written go-ahead removes most of it. Caveats: (a) the blessing fixes the risk, not the rate — solo CVPR stays $\sim 45\%$; (b) get the blessing to cover the specific act (withdraw 3DV + solo CVPR + acknowledgment), in writing; (c) settle Shai’s authorship in the same conversation; (d) “I didn’t contribute enough” is often modesty — make sure the no is considered (the 3-page summary exists for exactly this).
- **Ronen unasked / lukewarm / ambiguous** $\Rightarrow$ keep 3DV (low-temperature path): let it decide Dec 2, then ICML (private reviews) $\rightarrow$ ICCV. This is the $\sim 80\%$ path, chosen here for risk control, not for expected paper quality.

Bottom line: with either form of explicit Ronen sign-off, take the 70% path (CVPR) — the value asymmetry wins once the politics are defused. Without an answer from him, stay on the 80% path. Every cell of this table gets better or safer once the conversation has happened; none of it can be un-submitted afterward.

5. Mechanics if the CVPR branch fires

- Withdraw 3DV #524 on OpenReview *before* the CVPR abstract deadline ($\sim$ Nov 3) — keeps the dual-submission record clean.
- CVPR draft re-trim: content is ~ 0.7 pp over the 8-page limit — moves from “owed” to critical path.
- CVPR author registration + paper ID early; OpenReview profile fixes (name, advisor declarations, publication import) apply here too.
