

1DSfM · NYC_Library (32.6% outliers) — BA-aligned camera centers vs ground truth

madweight (ours, label-free)

translation error 2.94° · 67 gross-drift cams

RESfM (from-scratch, supervised)

translation error 6.28° · 17 gross-drift cams

Open markers = GT camera centers; small faint dots = well-placed estimates; large dots + connectors = gross-drift cameras ($>0.5 \cdot \text{scene scale}$ off GT). Label-free madweight leaves far fewer gross-drift cameras than the supervised from-scratch baseline. Cameras aligned to GT; same PCA view for both.
