

SS-RESfM Results Through VGPA's Five Lenses

Per-scene wins / mean vs. median with blow-up attribution / registration coverage / rotation
(RA-AUC pending pose-recovery program) — September 12, 2026

Reading guide

The five lenses VGPA uses against RESfM, applied to our full 5-seed matrix. **Per-scene wins** are matched-seed scene×seed cells vs. RESfM-scratch. **Trans med** is pooled over all scene×seed cells. Errors are computed over each method's own registered set (the same convention as VGPA Tables 1–2), so low-coverage methods are flattered on raw error — Nr% is the corrective context, and RA-AUC (which prices coverage in) is being added by the pose-recovery program.
